No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Score

                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes nucleic acids encoding PRO secreted and transmembrane proteins used therapeutically. The PRO proteins have cytostatic, anti-inflammatory, anti-proliferative and immunosuppressive activity. The proteins and polynucleotides can be used in therapy, identification of homologues, raising antibodies and design of probes and primers. They can be used in a range of diseases related to proteins that they have homology with, e.g. a PRO protein having homology to complement proteins may be used in inflammatory responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim

The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. Anti-PRO antibodies are useful for the affinity purification of PRO from recombinant cell culture or natural sources

                                                                                                                                                                                                                                                            The present invention describes human secreted and transmembrane PRO proteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bioactive molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAF44270 to AAF44470 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAF444087 to AAF44269 and AAB65154 to AAB65300 represent human PRO polymucleotide and protein sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton

Gerritsen I Hillan KJ, New isolated PRO polypeptide and encoding nucleic acid, useful for the diagnosis and treatment of disorders associated with the PRO polypeptide, such as AIDS, cancer, atherosclerosis, inflammatory disease and diabetes. 2003-174141/17. ABU55934. Botstein D, Eaton DL, Ferrara N, Filvaroff ME, Goddard A, Godowski PJ, Grimaldi JC, Gu , Kljavin IJ, Napier MA, Roy MA, Tumas D, W Gurney AL; Wood WI;

Claim

2; Fig 31; 178pp; English.

The invention relates to an isolated PRO polypeptide (a secreted or transmembrane protein) comprising: (a) at least 80% sequence identity or positives when compared to any of 15 sequences, fully defined in the specification, lacking or with its associated signal peptide; or (b) at least 80% sequence identity to a sequence encoded by the full-length coding sequence of a DNA deposited in the American Type Culture Collection (ATCC). Also included are: (1) an isolated nucleic acid comprising: (a) at least 80% sequence identity to a nucleotide sequence or full-length coding sequence with any of 15 full defined sequences of 957-3441 base pairs, given in the specification; or (c) at least 80% sequence identity to a full-length coding sequence of a

The methods and compositions of the present invention are useful for the diagnosis and treatment of disorders associated with the PRO polypeptide, such as AIDS (acquired immunodeficiency syndrome), cancer, atheroselerosis, inflammatory disease, diabetic complications, cardiac injury and organ failure. The antibodies can also be used in the different screening, therapeutic and biological assays. The present sequence is the cDNA encoding a PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          atch 100.0%;

The invention discloses isolated PRO secreted/transmembrane polypeptides CC comprising a sequence without signal peptide and the nucleic acid ce encoding them. The polypeptides can be used to raise antibodies that CC encoding them. The polypeptides can be used to raise antibodies that CC encoding them. The PRO polypeptide, for linking a bioactive specifically bind to the PRO polypeptide, for linking a bioactive conclude to a cell expressing a PRO protein and for modulating at least CC encoded to a cell expressing a PRO protein and for modulating at least CC polynuclectides are also useful in gene therapy, in chromosome CC identification, as chromosome markers, or in generating probes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, CC and the isolated nucleic acids may be used for recombinantly expressing CC those markers. The PRO polypeptides and nucleic acids may also be used in CC tissue typing. Anti-PRO antibodies are useful in diagnostic assays for CC and the affinity purification of PRO from recombinant cell culture or natural sources. The sequences presented in ABX90083-ABX90468 are the PRO genes encoding, the primers amplifying and the probes detecting the PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-DEC-1998

Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers. P-PSDB; ABU14005.

2; Fig 327; 649pp; English.

The present invention relates to the isolation of novel human PRO CC polypeptides, and the polynucleotide sequences encoding them. The PRO CC polypeptides are secreted and transmembrane proteins. The PRO CC polypeptides are useful for detecting other PRO polypeptides, for linking thousand the properties of cells expressing PRO polypeptides, and for for CC bioactive molecules to cells expressing PRO polypeptides, and for for CC chonogical activities of cells expressing PRO polypeptides, and for for CC chromosome and gene mapping, in the generation probes, in CC chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for generating transgenic animals of CC or knockout animals, to construct hybridisation probes for mapping the gene which encodes the PRO polypeptides, for generating transgenic animals of CC identification, as chromosome markers, in gene therapy, for chromosome CC identification, as chromosome markers, and for generating probes for PCR, CC Northern analysis, Southern analysis and Western analysis. The present CC sequence encodes a human PRO polypeptide of the invention. Note: The CC sequence data for this patent was obtained in electronic format directly from the USPTO web site at seqdata.uspto.gov/psipsDIDEntry.html

Gerritsen N
Hillan KJ,
                                                                                                                                   The invention relates to a human secreted and transmembrane polypeptide (PRO) and the polymcleotide encoding it. The PRO polypeptide or polymcleotide is useful in pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for detecting or treating cancers, inflammatory diseases, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome (AIDS) and diabetic complications in mammals, e.g. humans, dogs cats, cattle, horses, sheep, pigs, goats or rabbits. The sequences are also useful in biotechnological and medical research and in various industrial applications. This sequence represents a human PRO polynucleotide of the invention
                                                                                                                                                                                                                                                                                                                 New secreted and transmembrane polypeptides (e.g. PRO241, for use in pharmaceuticals, diagnostics or bioreactors, particularly for detecting or treating e.g. cancers, infertility or acquired immunodeficiency syndrome in mammals.
                                                                                                              Sequence

CC Type Culture Collection (e.g. ATCC Deposit No. 209621, 552-PTA, 819-PTA, CC 209439, 203135, etc); or a sequence with at least 80% identity to a DNA CC encoding a PRO polypeptide. The PRO polypeptides or polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These CC cancers (e.g. ovarian cancer, colorectal cancer, Kaposi's sarcoma, CC clukaemia or lymphoma), hepatitis B, multiple sclerosis, or Crohn's CC disease in mammals. The PRO polypeptides are useful in drug screening, CC particularly as targets for therapputic intervention in these diseases, CC and in the diagnostic determination of the presence of these diseases. CC The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation CC probes, or for screening libraries of human cDNA, genomic DNA or mRNA. CT from Genes may also be used in gene therapy, particularly for creplacing a defective gene. This sequence encodes a novel human secreted and transmembrane PRO polypeptides.

                                                                                                                                                                               CC transmembrane polypeptide (designated as PRO proteins). 15 PRO CC polypeptides and their encoding polynucleotides are disclosed. Also CC included are a vector comprising the PRO nucleic acid, a host cell comprising the vector, a process for producing a PRO polypeptide (by CC culturing the host cell under conditions for the expression of the PRO CC polypeptide, and recovering the PRO polypeptide from the cell culture, an isolated polypeptide having at least 80% amino acid sequence identity to CC the PRO polypeptides, a chimaeric molecule comprising PRO fused to a CC the PRO polypeptides, a chimaeric molecule comprising PRO fused to a CC the PRO polypeptides, a chimaeric molecule comprising PRO fused to a CC in chromosome and gene mapping, in generating sense and antisense RNA or CC in chromosome and gene mapping, in generating sense and antisense RNA or CC in chromosome and serveening of therapeutically useful reagents, and in cromosome and serveening of therapeutically useful reagents, and in CC gene therapy. The polypeptides may be used as molecular weight markers CC exids may also be used for chromosome identification, and tissue typing. PRO241 (identified as Chordin) is a candidate gene for Cornelia de Lange CC syndrome. Other PRO proteins are variously implicated in immune CC disorders, inflammatory disease, organ failure, atherosclerosis, cardiac CRRO proteins are variously implicated in immune CC AIDS, cancer and diabetic complications. The present sequence encodes a CC CR porotein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    invention may have antiinflammatory, antiarteriosclerotic, cardiant, anti-
infertility, anti-HIV, cytostatic and antidiabetic activities and may be
used in gene therapy. The nucleic acids and polypeptides are useful for
treating inflammatory diseases, organ failure, atherosclerosis, cardiac
injury, infertility, birth defects, premature aging, AIDS, cancer, or
diabetic complications. The nucleic acids are useful as hybridisation
probes, in chromosome and gene mapping, and in generating antisense RNA
or DNA. The polypeptides are useful as pharmaceuticals, diagnostics,
biosensors or bioreaccors. Both are useful in tissue typing. The present
sequence represents a nucleic acid sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or

P-PSDB; 2003-331911/31. DB; ABU82704.

New isolated PRO polypeptides e.g., PRO826, PRO1068, PRO1184, PRO1346 PRO1375, which stimulate proliferation of stimulated T-lymphocytes and are therapeutically useful for enhancing an immune response.

Claim 2: Fig 327; 653pp; English

CC Identity to: (i) one of 147 polypeptide sequences, given in the compensation; or (ii) The polypeptide sequences, given in the compensation; or (ii) The polypeptide lacking its associated signal compensation; or (ii) The polypeptide lacking its associated signal compensation; or propertide with or compensation; or propertide and are an isolated compensation; or propertide sequence encoding propertide. The properties of one compensation and propertide signal peptide. Also included are an isolated compensation; or propertide supports or propertide compensation; or propertide with a compensation; or propertide compensation; or propertide with a compensation; or propertide compensati wound healing and cancerous tumours, PRO812 (vascular endotnessas years) reactor (VEGF) inhibitor used to inhibit tumour growth), factor (VEGF) inhibitor used to inhibit tumour growth), PRO826/PRO1168/PRO1346/PRO1375 (stimulate proliferation of stimulated T-lymphocytes and are used to enhancing immune response), PRO828/PRO826/PRO1068/PRO1132(retinal disorders e.g. sight loss in mammals due to retinitis pigmentosum and age-related macular degeners

WPI; 200 P-PSDB; 2003-352829/33. DB; ABU72590.

New genes and secreted and transmembrane polypeptides (e.g. PRO183 or PRO184), useful for treating or diagnosing e.g. ovarian cancer, Kaposi's parcoma, leukemia, lymphoma, hepatitis B, multiple sclerosis or Crohn's disease.

Claim 1; Fig 327; 663pp; English

The invention describes a new isolated nucleic acid molecule comprising the full length coding sequence of the DNA deposited with the American CType Culture Collection (e.g. ATCC Deposit No. 209521, 552-PTA, 819-PTA, CC 209439, 203135, etc), or a sequence with at least 80% identity to a DNA CC encoding a PRO polypeptide. The PRO polypeptides or polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for detecting or treating e.g. malignancies or CC cancers (e.g. ovarian cancer, colorectal cancer, Kaposi's sarcoma, CC leukaemia or lymphoma), hepatitis B, multiple sclerosis, or Crohn's CC disease in mammals. The PRO polypeptides are useful in drug screening, CC particularly as targets for therapeutic intervention in these diseases, CC and in the diagnostic determination of the presence of these diseases. CC The PRO polypeptides are also useful as molecular weight markers, or for Cromosome identification. The PRO genes are useful as hybridisation or probes, or for screening libraries of human cDNA, genomic DNA or mRNA.

New transmembrane polypeptides and polynucleotides useful for chromosome identification, tissue typing, gene therapy, in chromosome and gene mapping, or as molecular weight markers.

Claim 2; Fig 31; 172pp; English.

The invention relates to an isolated nucleic acid encoding a secreted/ transmembrane polypeptide (designated as PRO proteins). 15 PRO polypeptides and their encoding polynucleotides are disclosed. Also included are a vector comprising the PRO nucleic acid, a host cell comprising the vector, a process for producing a PRO polypeptide (by culturing the host cell under conditions for the expression of the PRO polypeptide, and recovering the PRO polypeptide from the cell culture, an isolated polypeptide having at least 80% amino acid sequence identity to the PRO polypeptides, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence and an antibody which specifically binds

                                                                                                                                                                                                                                                                                                                                                                                                                                                       to PRO. The PRO nucleotide sequences are useful as hybridisation probes, in chromosome and gene mapping, in generating sense and antisense RNA or DNA, in generating transgenic or knock-out animals which can be used in the development and screening of therapeutically useful reagents, and in gene therapy. The polypeptides may be used as molecular weight markers for protein electrophoresis purposes. The PRO polypeptides and nucleic acids may also be used for chromosome identification, and tissue typing. PRO241 (identified as Chordin) is a candidate gene for Cornelia de Lange syndrome. Other PRO proteins are variously implicated in immune disorders, inflammatory disease, organ failure, atheroselerosis, cardiac injury, infertility, birth defects, premature aging, cardiac injury, ALDS, cancer and diabetic complications. The present sequence encodes a

New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, chromosome markers, or in generating probes.

Claim <u>ب</u> Fig 327; 650pp; English

The invention discloses isolated PRO secreted/transmembrane polypeptides comprising a sequence without signal peptide and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. The PRO polypeptides or polymucleotides are also useful in gene therapy, in chromosome identification, as chromosome markers, or in generating probes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for PRO, and in affinity purification of PRO from recombinant cell culture or natural sources. The sequences presented in ABX90083-ABX90468 are the amplifying and probes detecting the

Novel isolated PRO polypeptides e.g., PRO826, PRO1068, PRO1184, PRO1346 and PRO1375, which stimulate proliferation of stimulated T-lymphocytes are therapeutically useful for enhancing immune response and in cancer

Claim 2; Fig 329; 648pp; English.

The invention describes an isolated human PRO polypeptide. The PRO Colypeptides are useful in detecting PRO polypeptides in a sample, in CC linking a bloactive molecule to a cell expressing a PRO polypeptide, and civity of a cell expressing a PRO polypeptide, and clin modulating at least one biological activity of a cell expressing a PRO polypeptide, and complete the properties of the properties are thus caseful for treating conditions or disorders where angiogenesis would be peneficial, e.g. wound healthy and antagonist of this polypeptide are consecul for treating conditions or disorders where angiogenesis would be peneficial for treating cancerous tumours. PRO812 inhibits vascular cell send is thus useful for inhibiting endothelial cell growth in cells and is thus useful for inhibiting endothelial cell growth in cells and proliferation of endothelial cell growth in proliferation of endothelial cell growth in the proliferation of cells prophocytes and are therapeutically useful for enhancing cells (PRO11046 and PRO1375 stimulate proliferation of retinal neurons cells (PRO1132 is also enhances survival/proliferation of conditions of injuries, e.g. retinitis pigmentosum, AMD. PRO813 proliferation of conditions and proliferation of treating terming retinal cells and PRO1306 induce proliferation of mammalian kidney mesangial cells, and therefore are useful for treating retinal cells, and proliferation of disorders associated with dermatitis, herpetiformis or Crohn's cand therefore are useful for treating sports injuries, and arthritis. This sequence crowless and proliferation of chondrocytes in culture and are thus useful for treating sports injuries, and arthritis. This sequence

The methods and compositions of the present invention are useful for the diagnosis and treatment of disorders such as inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, diabetic complications and mutations in general. This sequence encodes a novel human secreted PRO protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated PRO polypeptide and encoding nucleic acids, useful for the diagnosis and treatment of disorders such as inflammatory disease, atherosis, cardiac injury, infertility, AIDS, cancer and diabetic necessary.

æ • US-09-944-929-82 (1-2284) ABX77120.SEQ cDNA encoding human PR0361 protein.

TOIG of: abx77120 check: 5044 from:

ABX77120 standard; cDNA; ВP

04-APR-2003 (first entry)

encoding human PRO361 protein

Gene; ss; human; antiinflammatory; antiarteriosclerotic; cardiant; anti-inferrility; anti-HIV; cytostatic; antidiabetic; transmembrane; antiinflammatory; anti-HIV; antiarteriosclerotic; cardiant; inferrility; anti-inferrility; cytostatic; antidiabetic; gene therapy; birth defect; inflammatory disease; organ failure; atherosclerosis; cardiac injury; premature aging; AIDS; cancer; diabetic complication.

Homo sapiens.

                                                                                                                                                                                                                                                                                    510 520 530 540 550 560 570 ARCIGCTACCTATTTTCTGTCCCAACGAGGAAGCCTGTCCATTGAAACCAGCAAAAGGACTTATGAGTTAC
                                                                                                                                                                                             invention may have antiinflammatory, antiarteriosclerotic, cardiant, anti-infertility, anti-HIV, cytostatic and antidiabetic activities and may be used in gene therapy. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. The present sequence represents a nucleic acid sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 2284 BP; 612 A; 576 C; 464 G; 632 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a nucleotide sequence encoding an isolated secreted and/or transmembrane protein. The nucleotide sequences of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 2; Fig 31; 173pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         160

New isolated PRO polypeptide and encoding nucleic acid, useful for the diagnosis and treatment of disorders associated with the PRO polypeptide, such as AIDS, cancer, atherosclerosis, inflammatory disease and diabetes.

Claim 2; Fig 31; 178pp; English.

The invention relates to an isolated PRO polypeptide (a secreted or transmembrane protein) comprising: (a) at least 80% sequence identity or positives when compared to any of 15 sequences, fully defined in the specification, lacking or with its associated signal peptide; or (b) at least 80% sequence identity to a sequence encoded by the full-length coding sequence of a DNA deposited in the American Type Culture Collection (ATCC). Also included are: (1) an isolated nucleic acid comprising: (a) at least 80% sequence identity to a nucleotide sequence that encodes a PRO protein; (b) at least 80% sequence identity to a nucleotide sequence or full-length coding sequence with any of 15 fully defined sequences of 957-3441 base pairs, given in the specification; or (c) at least 80% sequence identity to a full-length coding sequence of a DNA deposited under ATCC Accession No. 209528, 209527, 209570, 209618,

                                                                                                                                                                                                                                                                                                                       209621 or 209619; (2) a vector comprising the nucleic acid; (3) a host cell comprising the vector which, when cultured under conditions suitable for expression of the PRO polypeptide, produces the PRO protein; (4) a chimeric molecule comprising PRO fused to a heterologous amino acid sequence; and (5) an anti-PRO antibody. The methods and compositions of the present invention are useful for the diagnosis and treatment of disorders associated with the PRO polypeptide, such as AIDS (acquired immunodeficiency syndrome), cancer, atherosclerosis, inflammatory disease, diabetic complications, cardiac injury and organ failure. The antibodies can also be used in the different screening, therapeutic and biological assays. The present sequence is the cDNA encoding a PRO protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 2284 BP; 612 A; 576 C; 464 G; 632 T; 0 U; 0 Other;

English.

The present invention relates to the isolation of novel human PRO polypeptides, and the polynuclectide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for linking biological activities of cells expressing PRO polypeptides, for modulating biological activities of cells expressing PRO polypeptides, and for for identifying agonists or antagonists. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for generating transgenic animals or knockout animals, to construct hybridisation probes for mapping the gene which encodes the PRO polypeptide, and for the generation analysis of individuals with genetic disorders, in gene therapy, for chromosome identification, as chromosome markers, and for generating probes for PCR, and the polyment of the genetic gene because of the property of the generating probes for PCR, and the property of the generating probes for PCR, and the polyment of the generating probes for PCR, and the polyment of the generating probes for PCR. analysis, Southern analysis and Western analysis. probes The pr present

antiinflammatory, antianaemic, nootropic, antiparkinsonian, cerebroprotective, haemostatic, vulnerary, cycostatic, antipsoriatic, antibacterial, virucide, and fungicide activity. The proteins and nucleotide sequences are useful as nutritional sources or supplements and in research. The proteins are useful for treating immune deficiency and disorders, which may be genetic or resulting from infections, autoimmune disorders such as multiple sclerosis, systemic lupus erythmatosus, rheumatoid arthritis, and for treating myeloid or lymphoid cell deficiencies such as anaemias by regulating haematopoiesis. The proteins are also useful in compositions for bone, cartilage, tendon, ligament
                                                                                                                                                                                     This invention relates to 59 human secreted proteins and the nucleotide sequences encoding them. Sequences AAC59788-C59846 and AAB34667-B34745 represent the proteins and their encoding nucleotide sequences, and sequences AAB34746-B34771 represent fragments of the proteins. Probes for the DNA sequences are represented by sequences AAC59847-C59596. The proteins exhibit neuroprotective, dermatological, immunosuppressive, proteins exhibit neuroprotective, dermatological, immunosuppressive,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Secreted protein; human; autoimmune disorder; multiple sclerosis; ulcer; systemic lupus erythematosus; rheumatoid arthritis; anaemia; stroke; haematopoiesis regulation; tissue regrowth; wound healing; haemophilia; Alzheimer's disease; Parkinson's disease; Shy-drager syndrome; cancer; contraceptive; infection; growth inhibition; hyperproliferative disorder;
                                                                                                                                                                                                                                                                                                                                                                 Novel proteins and polypeptides useful for the treatment of e.g multiple sclerosis, systemic lupus erythmatosus, rheumatoid arthritis, cancer, Alzheimer's disease, Parkinson's disease, stroke, anemia and ulcers.
                                                                                                                                                                                                                                                                                                                               Claim 114; Page 453; 493pp; English.
